

DENIS KIARIE

Full Stack Developer (React | Django REST Framework | PostgreSQL)

Nairobi, Kenya | +254 726 916 068 | deniskiarie2@gmail.com

deniskiariedev.pro | github.com/DenisKiarie3 | linkedin.com/in/deniskiariedev

PROFESSIONAL SUMMARY

Full Stack Developer specializing in React and Django REST Framework, with production-grade experience in relational schema design, transaction-safe concurrency control, and third-party payment integration. Independently architected and built a multi-tenant SaaS platform featuring JWT-based authentication, HMAC-verified webhook payment processing, and 97 passing automated tests, deployed and running live across separately-hosted frontend and backend domains. Comfortable owning a feature end-to-end, from PostgreSQL schema design through a tested, deployed React interface. Seeking a Full Stack Developer role building production web applications with the same emphasis on correctness and code quality.

TECHNICAL SKILLS

Frontend: React, Redux Toolkit, React Query, React Router, Tailwind CSS, Framer Motion, JavaScript (ES6+), Zod

Backend: Python, Django REST Framework (DRF), RESTful API Design, JWT Authentication

Databases: PostgreSQL, Neon (managed PostgreSQL hosting)

Testing: pytest, Vitest, React Testing Library (RTL)

DevOps & Tools: Git, GitHub, VS Code, Postman, Netlify, Render, Continuous Integration/Continuous Deployment (CI/CD)

Practices: Row-Level Locking, Webhook Signature Verification (HMAC-SHA512), Multi-Tenant Architecture, CORS/CSRF Configuration, Accessibility (ARIA)

Also worked with: Node.js, Express.js, MongoDB

PROJECT EXPERIENCE

KukujeshiStocker — Full-Stack Inventory, POS & Payments Platform — Personal Project 01/2026 - 08/2026

Stack: React, Redux Toolkit, React Query, Tailwind CSS, Django REST Framework, PostgreSQL (Neon), JWT, Paystack API, Netlify, Render

GitHub: github.com/DenisKiarie3/KukujeshiStocker | Live Demo: kukujeshistocker.netlify.app

- Architected and built a full-stack, multi-tenant SaaS platform for inventory management, point-of-sale operations, and payment collection, using React and Redux Toolkit on the frontend and Django REST Framework on the backend.
- Designed a relational schema centered on an append-only stock-movement ledger with cached quantities, applying row-level locking (`select_for_update`) to guarantee correct inventory counts under concurrent sales and eliminate oversell conditions.
- Implemented authentication from the ground up, combining in-memory JWT access tokens, `httpOnly` refresh cookies, CSRF double-submit protection, and automatic token rotation and blacklisting on refresh and logout.
- Integrated Paystack end-to-end with HMAC-SHA512 webhook signature verification, independent server-side amount verification, and idempotent payment confirmation, preventing duplicate transaction processing; verified the full flow live against Paystack's test environment.
- Developed a RESTful API spanning 15+ endpoints with filtering, pagination, and permission-scoped queries enforcing strict tenant data isolation.

- Ran a self-directed security audit that surfaced and closed a duplicate-payment vulnerability before release, backed by 97 passing automated tests across pytest (Django) and Vitest/React Testing Library (frontend).
- Deployed the full application to production (Netlify, Render, Neon PostgreSQL), including diagnosing and resolving a live cross-origin authentication bug involving cookie scoping and CSRF protection across separately-hosted frontend and backend domains.

ClientFlow — Freelancer Invoicing & Client Management SPA — Personal Project 04/2026 – 07/2026

Stack: React, Redux Toolkit, Tailwind CSS v4, Framer Motion, React Router, Zod, Netlify CI/CD

GitHub: github.com/DenisKiarie3/clientflow | Live Demo: clientflow-invoice.netlify.app

- Built a freelancer invoicing and client-management single-page application in React and Redux Toolkit, with complete CRUD workflows, normalized state, and memoized cross-slice selectors for derived data.
- Designed a service-layer abstraction decoupling UI components from data sources, enabling a documented migration path from mock APIs to a Django REST backend with no changes to components or state management.
- Implemented dynamic real-time invoice calculations with Zod schema validation and a status-driven color-coding system applied consistently across dashboard, list, and detail views.
- Engineered protected routing with a redirect-to-intended-destination auth flow, a global toast notification system, and an error boundary for resilient failure handling.
- Delivered a fully responsive, accessible interface — animated navigation drawer, focus-trapped modals, and ARIA labelling — optimized with route-based code splitting (React.lazy/Suspense) and React.memo, and deployed with automated CI/CD from GitHub to Netlify.

EDUCATION

Bachelor of Science, Software Development — KCA University, Nairobi, Kenya | 2022 – 2025

Degree certificate and official transcripts awarded.

ADDITIONAL INFORMATION

Languages: English, Kiswahili.
